Assignment #01 10 marks

You will collect and analyze record-keeping practices at one of the following:

- **Medical Store**
- **Departmental Store**
- **School System**
- **Grocery Store**

The goal is to evaluate manual record management methods, understand the associated challenges, and identify potential areas for improvement in the database system.

Steps for Students to Complete the Assignment

1. Choosing any one of the above systems (Medical Store, Departmental Store, School System, Grocery Store):

- Students will select one of the given systems to analyze. The choice should depend on which system they are most interested in or have access to.

2. Gathering Information on Manual Record Management:

- **Medical Store:** Investigate how sales transactions, inventory, supplier records, and patient prescriptions are documented. Are these records handwritten, typed on paper, or stored in some other manual format?
- **Departmental Store:** Examine how records are kept for stock items, sales, employee shifts, and customer transactions. Is it done in a ledger, or do they use a simpler method like notepads or spreadsheets?
- **School System:** Explore how attendance, grades, student admissions, and teacher schedules are maintained. Are these records on paper, in spreadsheets, or in physical files?
- **Grocery Store:** Investigate how inventory is managed (e.g., stock levels), sales are recorded, and purchases are documented. Are records written manually or managed in a more structured but still manual way?

3. Identifying Manual Record Challenges:

- list out the challenges that arise from these manual systems:
    - **Time Consumption:** How much time is spent in record-keeping or searching for records?
    - **Human Error:** Are there issues with mistakes in data entry or retrieval?
    - **Data Duplication:** Are there cases of repetitive entries or inconsistent records?
    - **Security Issues:** How secure is the data? Is there a risk of loss or unauthorized access?

4. Understanding the Flow of Information:

- Analyze how information flows within the organization:
    - How is the data collected (e.g., customer transactions, stock updates)?
    - How is data shared between different departments or employees (e.g., from the cashier to the inventory manager)?
    - How often is the data updated or reviewed?

5. Proposing Database Solutions:

- After understanding the manual record management system, students should propose a database system solution:
    - How can the records be stored digitally to make the system more efficient?
    - Suggest what kind of queries could help in managing and retrieving data quickly.
    - Propose any additional features that could be included, such as data validation or real-time inventory updates.

6. Writing the Report:

- Students should compile their findings into a comprehensive report. The report should include:

- An introduction to the system they chose.
- A detailed analysis of their current manual record-keeping practices.
- A list of challenges faced in the manual process.

Submit before 24-09-25, 12 pm to CR/GR

You can submit in handwritten form or in print form

Same assignment/Copy each other… both will be graded zero

Minimum 5 pages

Submission after the due date is considered as not submitted
